

Collibra Data Access

Frictionless data access, backed by enterprise-grade control

Traditional access management tools weren't built for granular data security – leaving teams dependent on slow, manual, ticket-based processes that don't scale. Data consumers wait days for the data they need, access controls are scattered across siloed systems and sensitive information remains at constant risk of reaching the wrong hands.

Collibra Data Access centralizes access provisioning, data masking and policy enforcement and monitoring in a single interface, eliminating fragmented controls, reducing manual effort and getting secure, trusted data to the right people faster. Sensitive data is protected automatically, the right people get access without the wait, and compliance teams always have the visibility they need to stay in control.

Benefits

Simplify access without sacrificing control

Let data consumers intuitively request and receive access, reducing delays and helping them act on data faster – while data owners maintain full oversight of every decision

Track access provisioning activity

View an audit log for data access provisioning and monitor data access and usage to maintain visibility, reduce errors and support compliance.

Maintain consistent access across systems

Integrate with Okta and Microsoft Entra ID to define access controls once, enforcing consistent security across all data sources and accelerating provisioning.

Limit sensitive data exposure at the source

Apply column-level masking and row-level filtering so every user sees exactly what data they need – nothing more, nothing less.

Product highlights

Centralized data access management

Eliminate request backlogs and reduce admin overhead by centralizing access provisioning across Snowflake, Databricks and BigQuery.

Identity provider integration

Integrate with Okta and Microsoft Entra ID to define access controls once with universal users and groups, enforcing consistent security across all data sources.

Granular masking and filtering

Protect sensitive fields and limit record exposure with column-level masking and row-level filtering, automatically applied based on user roles or purpose.

Access audit logging

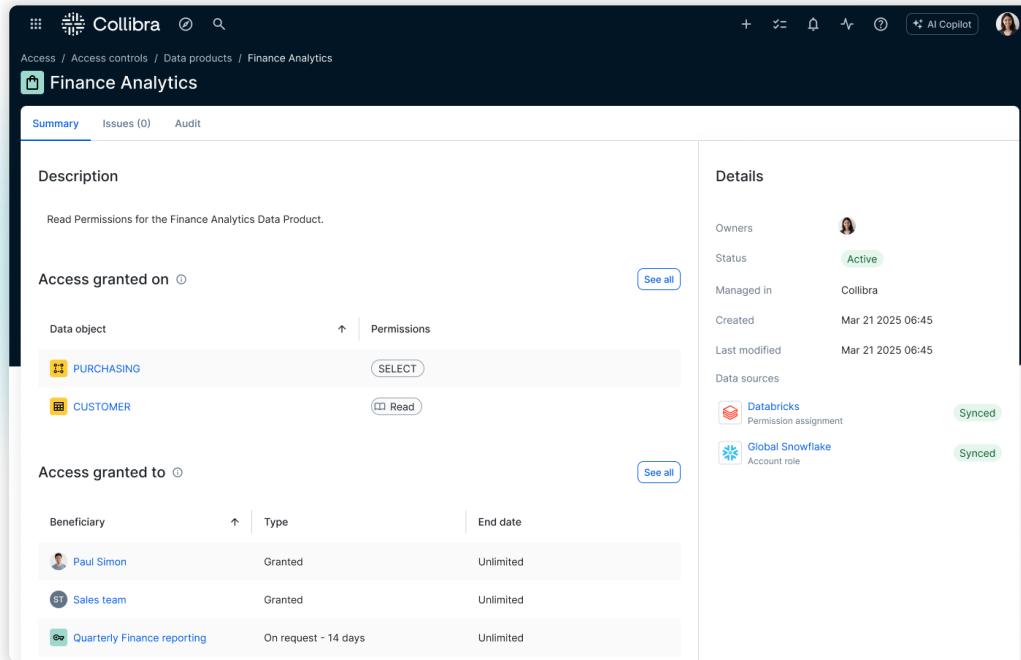

Maintain full visibility into provisioning activity with an audit log for data access requests and changes.

Attribute-based access controls

Provide the right level of access through attribute-based access controls that protect sensitive data and support regulatory requirements across your data estate.

Automated policy enforcement

Automatically apply protection rules based on data classifications (PII, PHI and more), reducing risk and ensuring consistent data protection without manual effort.

Manage access, enforce protection and maintain oversight across data sources from one centralized location
